Test Report

No: SHCPCH200504617E

Date: Jun 10 2020

Human Patch Test

Study Details

Type of study.....: Determination of irritating effects to the skin with an occlusive patch test.
Study Period.....: May 2020
Test subjects.....: 30(23-47 years old; 5 males and 25 females), 30 normal healthy
Test site.....: Forearm
Concentration.....: Undiluted
Negative Control.....: Blank
Positive Control.....: SDS (1% in water)

Summary Results

All participants completed the study. Under the test conditions, SDS (1% in water) caused positive reaction in 9 subjects. None of the subjects showed any reaction to the negative control and the test product.

Methodology

Introduction

The epicutaneous patch test allows us to assess the primary skin irritation potential of cosmetic-finished products and raw materials.

Description

All the work described in this expertise was conducted in accordance with the guidelines by COLIPA (Walker A.P. et al: Test Guidelines for Assessment of Skin Compatibility of Cosmetic Finished Products in Man. Food and Chemical Toxicology 34, 1996, 651-660). Because it was a study with humans, it was carried out in accordance with the Declaration of Helsinki (1964) and subsequent revisions.

Experiments were carried out on 30 volunteers (30 normal healthy subjects, 5 males and 25 females) between the ages of 23 to 47. The volunteers were clearly informed, verbally and in writing, regarding the nature of the study, the timetable, constraints and possible risks. They gave their written informed consent before participating in the study.

Participants could withdraw from the study at any time without giving reason. During the test period, the subjects refrained from using other substances on the test areas.

Inclusion criteria

- age more than 18 years old
- informed volunteers

Exclusion criteria

- Pregnant or lactating women
- Blemishes or marks (tattoos, sunburn) which interfere with scoring
- Any skin disease that may interfere with the aim of the study

Test Report

No: SHCPCH200504617E

Date: Jun 10 2020

Procedure

The product was applied in a concentration as outlined above in 8mm Finn Chamber to the forearm of the panelists for a period of 48 hours. Proper adherence of the test patches was assured by the inclusion of sodium dodecyl sulphate (SDS) in one concentration (1%) as positive control. Blank was used as a negative control.

The treatment sites were assessed for the presence of irritation by dermatologist at 48 h (30 min after patch removal), 72h and 96h after patch application.

Scoring scale

ERYTHEMA (abbr. E)

- 0 = no evidence of erythema
- 0.5 = minimal or doubtful erythema
- 1 = slight redness, spotty and diffuse
- 2 = moderate, uniform redness
- 3 = strong uniform redness
- 4 = fiery redness

DRYNESS (SCALING) (abbr. D)

- 0 = no evidence of scaling
- 0.5 = dry without scaling; appears smooth and taut
- 1 = fine/mild scaling
- 2 = moderate scaling
- 3 = severe scaling with large flakes

OEDEMA (abbr. O)

- = absence of oedema
- + = presence of oedema
